Small, thin wind slabs triggered, Storm Castle Ridge

Moose Jaw Northern Gallatin 1/18/2023 Code SS-ASu-R1-D1-S Latitude 45.44940 Longitude -111.07600 Notes

Number of slides

Today we toured up Storm Castle Ridge with hopes of skiing the 19th Street <u>Couloir</u>. On the approach we were able to <u>trigger</u> small (2-4") wind slabs on most lee aspects, these slides ran fast and far for their size. We dug a pit at 9200' on a North <u>aspect</u> and we're able to identify the <u>surface hoar</u> but had no results on our ECT. With 2 spotters I dug an ECT 10m below the top of the 19th Street <u>Couloir</u> and got and ECTP12@ 35cm below the surface. The <u>slab</u> was 35cm thick, pencil hardness and failed on <u>faceted snow</u>; the buried <u>surface hoar</u> found in most other pits was not present. We bailed to the opposite side of the ridge and enjoyed some wonderful burn skiing.
