Unstable snowpack near Cooke

Date Mon, 02/05/2024 - 11:25

We skied south of Cooke City and dug a <u>snowpit</u> at 9,761' on a west facing slope. We had an ECTP21, 40 cm below the surface (16" down). There was 6-8" of new snow from the weekend above 4" of soft old snow, on top of 4" of a pencil- hard <u>slab</u>, then the soft sugary facets to the ground. ECT broke below the hard <u>slab</u> at the top of the facets (photo). I had one <u>collapse</u>, 10-12' wide near treeline where there was little more wind-<u>loading</u>/effect (photo).

The unstable test score, very poor snowpack structure, and <u>collapse</u> indicate a person could easily <u>trigger</u> a large avalanche on steep slopes.

Snowed lightly on and off all day with a couple cm accumulation. Wind was light-moderate out of the southwest with mostly overcast skies.

Region Cooke City Location (from list) Republic Creek Observer Name Alex Marienthal
